1. Project Overview

The objective of this project is to design, develop, deploy, and configure a centralized IT Ticket Management System to streamline incident management, service requests, and change requests across the organization. The solution will provide a structured workflow with configurable approval processes, role-based access, notifications, ticket tracking, testing, vendor collaboration, and reporting.

2. Objectives

- Centralize IT support requests.
- Standardize ticket handling workflows.
- Improve visibility of ticket status and ownership.
- Ensure approvals are obtained wherever required.
- Maintain complete audit trails.
- Reduce response and resolution times.
- Support collaboration between internal teams and external vendors.
- Provide configurable workflows without requiring software modifications.

3. Functional Scope

3.1 User Roles

The system shall support configurable user roles including, but not limited to:

a. End Users

- Raise IT issues and service requests.
- Track ticket status.
- View their own tickets and history.

b. IT Users

- Raise technical tickets.
- Track assigned tickets.

- Respond to clarification requests.
- View ticket history.

c. Ticket Administration Team

- Review approved tickets.
- Classify ticket type.
- Assign tickets.
- Monitor SLAs.
- Configure workflows.
- Create custom fields.
- Manage notifications.

d. Department Heads

- Review tickets raised by users within their department.
- Approve or reject tickets before forwarding to the administration team.

e. Management Team

- Review and approve Change Requests.
- Approve or reject implementation requests.

f. Testing Team

- Validate completed work.
- Close tickets after successful verification.
- Reopen or escalate tickets if issues persist.

g. External Vendors

- Secure login access.
- View only assigned tickets.
- Update progress.
- Request clarifications.

- Resolve assigned tickets.

h. Other Departments

Examples:

- Operations
- Risk
- Business
- Compliance
- Other configurable departments

These users can provide clarifications or responses whenever requested by the Administration Team.

3.2. Ticket Creation

The system shall allow users to create tickets through an intuitive interface.

During ticket creation, users shall be able to:

- Select Application/System
- Select Severity
- Enter Subject
- Enter Description
- Attach supporting documents/screenshots
- Select Priority (if permitted)
- Submit ticket

Dynamic Application Forms

The ticket form shall support dynamic questionnaires.

When a user selects an application, additional application-specific questions shall automatically appear.

Examples include:

- Error codes

- Module name
- Customer number
- Device information
- Environment
- Browser
- Version
- Transaction details

The questionnaire shall be configurable by administrators without software modification.

3.3 Application-wise Access Control

The system shall support application-level permissions.

Each department or user group shall only be allowed to view and create tickets for applications assigned to them.

3.4 Ticket Workflow

Step 1

User creates ticket.

↓

Step 2

Approved tickets are notified to the department heads for their approval.

Ticket is routed to the Administration team.

Administration team may:

- Assign directly
- Request clarification
- Classify ticket
- Forward to another department head

- Forward to vendor

↓

Step 3

Ticket is routed to the Administration team.

Administration team may:

- Assign directly
- Request clarification
- Classify ticket – Classification to be done automatically. Admin team needs option to classify manually as well.
- Forward to another department head
- Forward to vendor

↓

Step 4

Administration Team reviews the ticket.

They may:

- Assign directly
- Request clarification
- Classify ticket
- Forward to another department
- Forward to vendor

3.5. Ticket Classification

The Administration Team shall classify tickets into configurable categories such as:

- Incident
- Issue
- Service Request

- Change Request

Additional categories may be configured in the future.

3.6 Change Request Workflow

If a ticket is classified as a Change Request:

User

↓

Administration Team Review

↓

Department Head Approval

↓

Management Approval

↓

Implementation Assignment

↓

Testing

↓

Closure

If rejected at any stage, appropriate notifications shall be sent.

3.7 Ticket Assignment

The Administration Team shall assign tickets to:

- Internal IT engineers
- Functional consultants
- Technical consultants

- Developers
- Infrastructure engineers
- External vendors
- Testing team

Assignments shall include:

- ETA
- Due Date
- Priority
- Remarks
- Attachments

3.8 Clarification Requests

During any stage, authorized users shall be able to request clarification from:

- Ticket creator
- Department Head
- Other Departments
- Vendors
- Management

Responses shall become part of the ticket history.

3.9 Cross Department Collaboration

The Administration Team shall be able to involve additional departments including:

- Operations
- Business
- Risk

- Compliance
- Other configurable departments

These departments shall receive notifications and respond through the portal.

3.10 Vendor Portal

The system shall provide a secure portal for external vendors.

Vendors shall be able to:

- Login securely
- View assigned tickets only
- Update work progress
- Upload attachments
- Request clarifications
- Resolve tickets

Vendors shall not have access to unrelated tickets.

3.11 Testing & Verification Workflow

Once implementation is completed:

Administration Team

↓

Assign to Tester

↓

Tester validates solution

↓

If Passed

Close Ticket

↓

If Failed

Escalate back to implementation team

↓

Continue until resolved

3.12 Ticket Closure

Tickets may only be closed after successful verification by the assigned tester or other authorized personnel, based on the configured workflow.

Closure shall include:

- Resolution summary
- Root cause
- Resolution time
- Closure remarks
- Closure date

3.13 Ticket Timeline & History

Each ticket shall maintain a complete chronological history including:

- Ticket creation
- Approvals
- Assignments
- Status changes
- Clarification requests
- Responses
- Notes
- Attachments

- ETA changes
- Escalations
- Testing activities
- Closure information

The history shall be visible to authorized users.

3.14 Notifications

The system shall automatically notify relevant users throughout the ticket lifecycle.

Notifications shall include events such as:

- Ticket created
- Ticket submitted
- Department Head approval required
- Ticket approved/rejected
- Assignment
- Reassignment
- Clarification requested
- Clarification received
- ETA assigned
- ETA updated
- Due date reminders
- Change Request approval
- Management decision
- Testing assigned
- Testing completed
- Ticket reopened

- Ticket resolved
- Ticket closed

Notifications may be delivered via:

- System notifications
- Email notifications – If any user replies in a ticket thread, it should automatically added to that ticket history.

3.15 Configurable Custom Fields

Administrators shall be able to create custom fields without software development.

Custom fields shall be supported for:

- Ticket creation
- Ticket assignment
- Ticket updates
- Resolution
- Testing

Supported field types include:

- Text
- Number
- Date
- Dropdown
- Multi-select
- Checkbox
- Radio button
- Attachment
- Lookup fields

Fields may be configured as:

- Mandatory
- Optional
- Visible
- Hidden
- Role-based

3.16 Ticket Search & Filters

Users shall be able to search and filter tickets using configurable criteria including:

- Ticket Number
- Status
- Priority
- Severity
- Application
- Assigned User
- Department
- Category
- Date Range
- Vendor
- Tester
- Creator

3.17 Dashboards & Reports

The system shall provide configurable dashboards and reports including:

- Open tickets
- Closed tickets

- Pending approvals
- Tickets by application
- Tickets by department
- Tickets by severity
- Tickets by assignee
- Change Requests
- Vendor performance
- SLA compliance
- Resolution trends
- Aging analysis
- Escalated tickets
- Tester performance

Reports shall support export to Excel and PDF.

3.18 Administration Module

The Administration module shall provide configuration for:

- Users
- Roles
- Departments
- Applications
- Ticket categories
- Severity levels
- Priorities
- Statuses
- Approval workflows

- Notification templates
- Dynamic questionnaires
- Custom fields
- Vendor accounts
- SLA settings
- Testing workflows

Points Discussed on 24/10/2026

Attendees: Navaneetha Krishnan (iProAT), Nagaraj (UFC), Shivakumar (UFC), Prabahar (UFC)

1. Ticket Classification and Auto-Assignment

- Tickets should be automatically assigned to the designated technician based on the ticket classification.
- The system should support main classifications such as:
    - Networking
    - Applications
    - Other configurable categories etc.,
- Each main classification should have sub-classifications, such as Under Application, option to create sub groups like Flexcube, Atomverse, and Firewall etc.
- One or two technicians can be assigned to each sub-classification.
- Different issue types should be configurable under each sub-classification. For example, under Flexcube, need option to create different issues like
    - Application not opening
    - Password reset
    - Login not working etc.
- An SLA should be defined for each issue type. Because issues like login not working needs a faster SLA while other issues can have a slower SLA.

2. SLA and Severity Management

- The system should automatically determine the ticket severity based on the configured SLA and issue classification.
- SLA configurations should be maintained at the issue-type level.
- The SLA configuration should also include a configurable time limit for HOD approval or rejection, where applicable. If a ticket is not approved by HOD within that time, end user needs to be notified.

3. Change Request Workflow

- Change requests should follow a separate workflow.
- Once the assigned technician completes the work, the ticket should be forwarded to the Testing Team for testing.
- Technicians can classify a ticket as change request and it will be sent to HOD for first approval.
- The system should provide an option to configure whether HOD approval is required for each change request.
- If HOD approval is not required, the ticket should be forwarded directly to the Admin Team.
- Technicians should be able to refer tickets to the Admin Team when the ticket needs to be handled as a change request.

4. HOD Approval and Notifications

- For tickets requiring HOD approval, the system should notify the end user if the HOD does not approve or reject the ticket within the configured time limit.
- The approval time limit should be configurable for each issue type as part of the SLA settings.
- HODs should have the option to refer tickets to other departments for clarification or additional information.
- The ticket referral feature should be available only to HODs and the Admin Team, and not to end users.

5. Active Directory Integration

- The system should support user authentication through Active Directory (AD).
- Existing user and manager information configured in Active Directory should be used for authentication and relevant workflow assignments.

6. Ticket Resolution, Closure, and Reopening

- Once a technician resolves a ticket, the ticket should remain in the resolved status until the end user closes it.
- If the end user does not close a resolved ticket within a configurable period, the HOD should be notified.
- If an end user reopens a resolved ticket, it should be routed directly to the Admin Team.
- The system should allow administrators to configure a threshold for unresolved closures, whereby end users who have a specified number of resolved but unclosed tickets will be restricted from creating new tickets until the outstanding tickets are closed.

7. Reporting and Automated Notifications

- The system should generate automated reports for the HOD, Admin Team, and Technicians.
- Reports should provide ticket counts by status, including:
    - Open
    - Resolved
    - Closed
    - Pending
- Reports should cover each stage of the ticket lifecycle and provide visibility into the number of tickets handled by the HOD, Admin Team, and Technicians.
- Weekly reports should be generated for the HOD, end users, and Admin Team.
- Reports should support monitoring ticket volumes, resolution progress, pending approvals, and outstanding closures.

8. Database Security

- The system database should be encrypted to protect stored information and ensure data confidentiality.
